EXTENDED BAKERY Summary Table

| Dataset | minSup | minConf | Number of Skyline Association Rules |
|---------|--------|---------|-------------------------------------|
| 1000 | 0.025 | 0.75 | 20 |
| 5000 | 0.03 | 0.49 | 19 |
| 20000 | 0.03 | 0.49 | 18 |
| 75000 | 0.03 | 0.49 | 18 |

Procedures to Find Best Values of minSup and minConf

EXTENDED BAKERY 1000

| minSup | minConf | Number of Skyline Frequent Itemsets | Number of Skyline Association Rules |
|--------|---------|-------------------------------------|-------------------------------------|
| 0.05 | 0 | 38 | 4 |
| 0.025 | 0 | 32 | 42 |
| 0.025 | 0.75 | 32 | 20 |

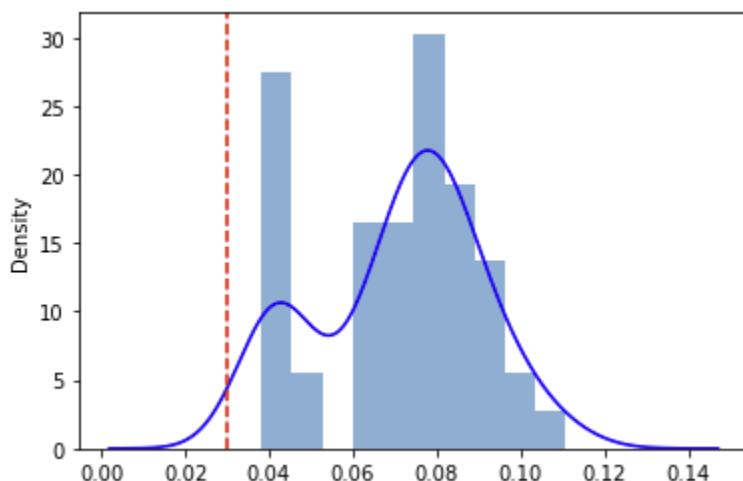

When looking at the density plot of the mean of this market basket dataset, we saw that there was a local minimum around 0.05, displaying a separation between support values. We wanted to initially include a large number of association rules in finding a good minSup. So, we ran the algorithms with minSup = 0.05 and minConf = 0. With these values, we got only 4 association rules, so we decided to lower the minSup to 0.025, resulting in 42 association rules. From here, we only wanted to assert association rules with higher confidence in order to find itemsets that had stronger relationships between items, so we increased minConf to 0.75. This decreased our number of association rules to 20.

For the remaining EXTENDED BAKERY datasets, we followed a similar process of starting with a minConf = 0 and decreasing minSup until we got enough frequent itemsets. Once we settled on a minSup value, we would increase minConf to filter our association rules.

Note: The reported support and confidence values are multiplied by 100 to represent percentages, although minSup and minConf are decimals.

EXTENDED BAKERY 5000

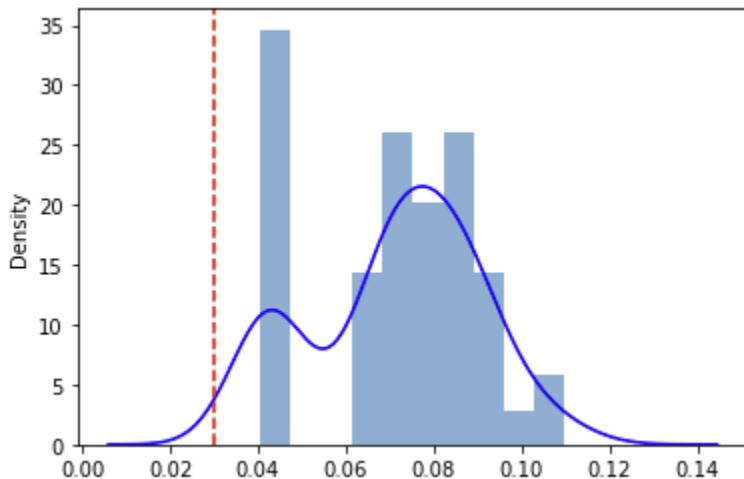

| minSup | minConf | Number of Skyline Frequent Itemsets | Number of Skyline Association Rules |
|---------------|----------------|--|--|
| 0.05 | 0 | 37 | 2 |
| 0.04 | 0 | 38 | 17 |
| 0.03 | 0 | 35 | 37 |
| 0.03 | 0.49 | 35 | 19 |

We noticed that there were association rules that had higher support values from 0.04 to 0.05 but had lower confidence values from 0.3 to 0.6. These itemsets more commonly appeared together but were not as strongly related, compared to the itemsets that had higher confidence and lower support values. Since we also found this type of relationship important, we chose a minConf of 0.49 that was high enough to show strong relationships between the items, but low enough to assert the association rules with high support. We followed this similar thought process for the 20000 and 75000 datasets. We settled on using minSup = 0.03 and minConf = 0.49 for both.

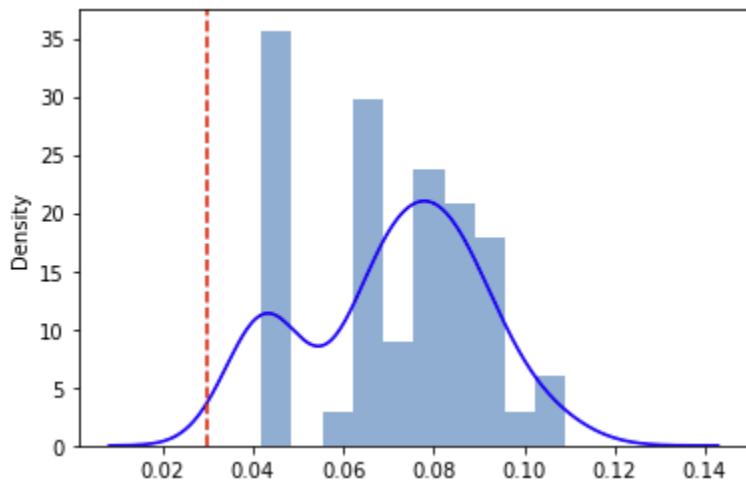

EXTENDED BAKERY 20000

| minSup | minConf | Number of Skyline Frequent Itemsets | Number of Skyline Association Rules |
|---------------|----------------|--|--|
| 0.05 | 0 | 37 | 2 |
| 0.03 | 0 | 39 | 40 |
| 0.03 | 0.49 | 39 | 18 |

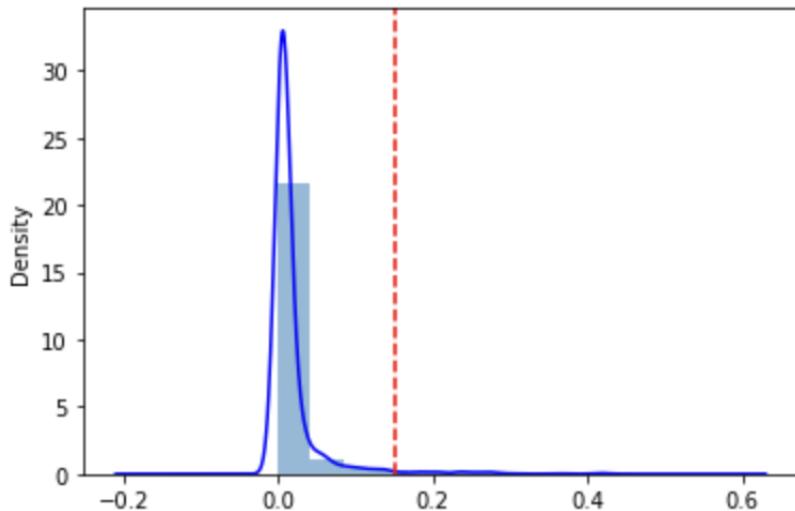

EXTENDED BASKET 75000

| minSup | minConf | Number of Skyline Frequent Itemsets | Number of Skyline Association Rules |
|---------------|----------------|--|--|
| 0.03 | 0.49 | 38 | 18 |

Fantasy Bingo

| minSup | minConf | Number of Skyline Frequent Itemsets | Number of Skyline Association Rules |
|---------------|----------------|--|--|
| 0.05 | 0 | 405 | 821 |
| 0.15 | 0 | 29 | 12 |
| 0.15 | 0.4 | 29 | 9 |

First, we tested the `minSup` at 0.05 seeing that there was the highest density of support values around this area. However, at this `minSup` value we found too many frequent itemsets and association rules. We found that increasing `minSup` to 0.15 reduced our frequent itemsets to 29 and our association rules to 12. To only retain association rules with a higher confidence, we increased `minConf` to 0.4, resulting in a total of 9 association rules.

EXTENDED BAKERY 1000 Results

Number of Skyline Frequent Itemsets: 32

Itemset 1: Chocolate Eclair [sup=0.034]
 Itemset 2: Vanilla Eclair [sup=0.037]
